Bureau of State Services
Division of Special Health Services
Tuberculosis Program

SUMMARY FOR APRIL 1, 1955

| AREA | Number of Hospitals for the Care of TB Patients | | | Number of TB beds in hospitals which have 5 or more TB beds |
|-------------------------------|---|---|-------------------|---|
| | Total | No specific number of TB beds or less than 5 TB beds ¹ | 5 or more TB beds | |
| TOTAL NON-FEDERAL AND FEDERAL | | | | |
| United States & Territories | 1,097 | 425 | 672 | 113,169 |
| United States | 1,071 | 421 | 650 | 108,235 |
| Territories | 26 | 4 | 22 | 4,934 |
| NON-FEDERAL | | | | |
| United States & Territories | 928 | 394 | 534 | 92,237 |
| United States | 910 ² | 391 | 519 | 87,914 |
| Territories | 18 | 3 | 15 | 4,323 |
| FEDERAL | | | | |
| United States & Territories | 169 | 31 | 138 | 20,932 |
| United States | 161 | 30 | 131 | 20,321 |
| Territories | 8 | 1 | 7 | 611 |

¹In most instances these are the hospitals which take patients for diagnosis, surgery, or emergency treatment pending transfer to other institutions.

²In addition to this number, there are four hospitals under construction which will add more than 900 beds. These hospitals are listed in this Index because they will probably be in operation prior to the publication of the 1956 Index.

INTRODUCTION

This is the tenth annual edition of the Index of Hospitals and Sanatoria with Tuberculosis beds in the United States and Territories. This Index gives information as of April 1, 1955, about tuberculosis beds in the non-Federal and in the Federal hospitals, but does not include data on mental hospitals or on penal institutions other than Federal penitentiaries.

Except for data on the Federal hospitals, most of which were obtained through direct contact with the responsible agencies, all data were obtained through a survey made by means of a post card questionnaire which was mailed during April 1955, to each of about 1,000 hospitals.

A comparison is made here of the data received on the April 1, 1954, and the April 1, 1955, bed census questionnaires.

TUBERCULOSIS BEDS (FEDERAL AND NON-FEDERAL) United States and Territories

| | 1954 ¹ | 1955 |
|--------------------------|-------------------|---------|
| Rated Capacity | 116,526 | 113,169 |
| Beds Occupied | 99,251 | 94,641 |

There was a decrease in the total number of tuberculosis beds of almost 3 percent; the number of non-Federal beds decreased by 2.8 percent; the number of Federal beds by 3.3 percent.

The decrease in the number of tuberculosis beds occupied was 4.6 percent; the number occupied in non-Federal hospitals decreased by 4.6 percent; the number occupied in Federal hospitals decreased by 4.8 percent.

NON-FEDERAL HOSPITALS

The non-Federal hospitals are those owned and operated by:

- States
- Local Governments (City, County, District)
- Other (Private, eleemosynary, and nonprofit organizations)

Information obtained from the 1954 post card questionnaire indicated that on April 1, 1954, there were 94,890¹ tuberculosis beds in the non-Federal hospitals. Information obtained from the 1955 post card indicated that on April 1, 1955, there were 92,237 non-Federal beds, or a decrease in the number of tuberculosis beds in the non-Federal hospitals in the United States and Territories of 2.8 percent (2,653 beds). Fifty-two hospitals, with a total of 3,572 tuberculosis beds, either closed, or their tuberculosis units closed, during this period and three new hospitals with a total of more than 600 tuberculosis beds, were completed and in operation between April 1, 1954, and April 1, 1955.

¹Adjusted figure.

and April 1, 1955. Some of this new construction represents replacement of unsuitable facilities rather than additional facilities.

The number of tuberculosis beds (official rated capacity) of the non-Federal hospitals in the United States and Territories totaled 92,237, but more than 4 percent of these beds were not available for use on April 1, 1955, and about 14 percent (more than 12,000) of the total number of beds which were available to patients were vacant (table 2, page 3).

Non-Federal Beds Available - Change from April 1, 1954, to April 1, 1955.

There was a decline of almost 2,400 in the number of available tuberculosis beds in the non-Federal hospitals. In the continental United States the number of beds available declined by about 2,200.

Non-Federal Beds Occupied - Change from April 1, 1954, to April 1, 1955.

The decline in the number of patients occupying beds in the non-Federal hospitals in the United States and Territories amounted to 3,666 or between 4 and 5 percent (table 3, page 4). In the continental United States alone the number of patients in non-Federal hospitals was 72,279 or 4.5 percent (3,421) less than the number of patients who were occupying beds on this same date one year previous. In the hospitals in the Territories the number of patients hospitalized decreased 6.5 percent (245). This decline in the occupancy of tuberculosis beds is discussed in detail under "Interpretation of the Data," in the following section of this Index.

Federal Hospitals

The Federal Hospitals include those controlled by the:

Air Force
Army
Navy

Public Health Service
Veterans Administration
Federal Bureau of Prisons

Tuberculosis beds are now available at two bases for the use of Air Force personnel. The number of beds available at the Parks Air Force Base, Pleasanton, California, decreased from 180 beds on April 1, 1954, to 100 beds on April 1, 1955: but 35 beds were made available at the Sampson Air Force Base, Geneva, New York.

The Army and Navy hospitals listed in this Index are those which have special facilities for the care of tuberculosis patients. There are other armed forces hospitals in which some beds are occupied by tuberculosis patients, but these hospitals are not listed because the respective services do not consider them permanent tuberculosis facilities.

There are six United States Public Health Service general hospitals which had tuberculosis clinical services on April 1, 1955. This number is one less than the number of hospitals in this category on the same date in 1954. The Staten Island hospital for thoracic surgery no longer operates a tuberculosis clinical service and does not have a fixed number of beds available for tuberculosis patients. "Tuberculosis clinical service" is defined as an organized unit within

the hospital with a specially assigned medical or dental professional staff (to which at least one member is assigned full time) that has administrative and clinical responsibility for the care of patients with types of illnesses falling within the province of one of the recognized medical specialties. The hospitals which do not operate a separate tuberculosis service do not report the number of tuberculosis beds available and necessarily have been omitted from this publication, although there are usually a few tuberculosis patients in these hospitals.

In addition to the six Public Health Service general hospitals there is one Public Health Service tuberculosis hospital which is located at Manhattan Beach, New York. All seven hospitals are listed in this Index.

All Veterans Administration hospitals which had operating tuberculosis beds on March 31, 1955, are listed. The operating beds have been reported by type of bed patient, rather than by type of bed section, which was the method in effect in April 1954. Reporting by type of bed patient is much more satisfactory since the patients in the surgical and physical medicine rehabilitation wards are included. These beds were not included when the reporting was by type of bed section.

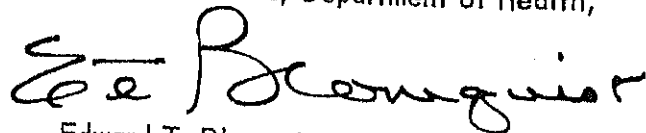

The total number of Federal beds shown in the summary table (and in table 8, by State, page 11) cannot be compared with the total number shown in the summary table of the edition of April 1, 1954. In the 1954 edition, 129 Federal hospitals with 19,959 beds were listed for the United States and Territories. In the fall of 1954, however, we learned that the number of operating beds of the Veterans Administration hospitals had been underestimated by 1,677 beds, due to the method of reporting (by type of bed section). This additional number of beds would bring the total Federal facilities to 21,636 beds on April 1, 1954. On April 1, 1955, there were 138 Federal hospitals with 20,932 beds. It can therefore be seen that a decrease of slightly more than three percent in the number of beds (rated capacity) has taken place, rather than the increase which is indicated when a comparison is made of the number of Federal beds listed in these two issues of the Index.

About 90 percent of all Federal beds were in use on April 1, 1955. A comparison of the number of patients hospitalized in Federal institutions on April 1, 1954, with those hospitalized on April 1, 1955, however, shows a decline in the number of beds occupied in Federal facilities of 4.8 percent.

ACKNOWLEDGEMENT

We extend our thanks to the superintendents and other hospital personnel who provided the information contained in this publication. We also want to thank all other persons who offered us helpful information or who assisted us in locating facilities which had not been listed in previous editions.

Comments about this Index will be appreciated. They should be addressed to: Tuberculosis Program, Division of Special Health Services, Public Health Service, Department of Health, Education, and Welfare, Washington 25, D. C.

CHANGE IN TUBERCULOSIS BEDS OCCUPIED

April 1, 1954 - April 1, 1955

By Stanley Glaser and Josephine Johnston

Information in this section of the Index will largely be confined to the trend taking place in tuberculosis bed occupancy. For convenience, the term "TB bed occupancy" as used in this section means the "number of TB beds occupied," and does not denote "the percentage of TB bed capacity which is occupied."

Most of the data were obtained by means of the post card questionnaire which is mailed annually during April to all hospitals in the United States and Territories which have beds for the care of tuberculosis patients. The results of the most recent survey of April 1, 1955, indicate that between April 1, 1954, and April 1, 1955, there was an average decline of 4.6 percent in the number of patients occupying tuberculosis beds.

In the September 1955 issue of Public Health Reports a study was published that was similar to the one being discussed here. It had been conducted jointly by the Tuberculosis Program, Division of Special Health Services, and the National Tuberculosis Association. It differed in two important respects from the present study. Because it dealt with data about an 8-month period, rather than a whole year, the data were influenced by the seasonality of tuberculosis bed occupancy - an influence which the authors appreciated but were unable to adjust with precision. Because it dealt with data from a large proportion of hospitals with tuberculosis beds, but not with all of them, and because there was no control of the distribution of the non-respondents, there was - it now appears - a greater tendency for the hospitals with declining (rather than increasing) occupancy rates to report. That study enabled us to make a better estimate of the decline in tuberculosis bed occupancy than had been possible previously - when the only information available was occasional reports from some tuberculosis hospitals, health departments, or newspaper stories about tuberculosis hospitals closing. However, that study overestimated the decline in tuberculosis bed occupancy and deduced from the components of that decline some conclusions which do not now appear to be appropriate.

In the past, most States lacked enough beds for the care of known tuberculosis patients. Recently, however, the supply seems to have caught up with the demand. In 1953 the number of patients occupying tuberculosis beds reached its peak; then between April 1, 1953, and April 1, 1954, there was a slight decline in tuberculosis bed occupancy - a decline of less than 1 percent. During the following period, April 1, 1954, to April 1, 1955, the decline increased to 4.6 percent. However, even with this decline, there were more tuberculosis patients hospitalized in 1955 than in any year prior to 1952. In table 1 a comparison is shown of data received by a similar questionnaire over the period of 7 years, from 1949 to 1955. (Data available prior to 1949 are not as complete as those shown in this table.) Index numbers have been employed in table 1 for ease in comparing the number of tuberculosis beds and number of patients occupying beds during these years.

TABLE 1. TUBERCULOSIS BEDS AND TUBERCULOSIS BED UTILIZATION (FEDERAL AND NON-FEDERAL) UNITED STATES AND TERRITORIES, 1949 - 1955¹

| Year | Number of Tuberculosis Beds | | Percent Occupancy | Index Number (1950 = 100) | |
|------|-----------------------------|---------------------|-------------------|---------------------------|-----------------|
| | Rated capacity | Occupied | | Number of beds | Number Occupied |
| 1949 | 103,800 | 87,400 ² | 84.2 | 99 | 96 |
| 1950 | 105,100 | 90,800 ² | 86.4 | 100 | 100 |
| 1951 | 109,200 | 93,100 | 85.3 | 104 | 103 |
| 1952 | 112,300 | 97,000 | 86.4 | 107 | 107 |
| 1953 | 114,500 | 100,200 | 87.5 | 109 | 110 |
| 1954 | 116,500 ³ | 99,300 ³ | 85.2 | 111 | 109 |
| 1955 | 113,200 | 94,600 | 83.6 | 108 | 104 |

¹No hospitals are included which had less than 5 beds for the care of tuberculosis patients. Tuberculosis beds in mental hospitals and in non-Federal penal institutions are also excluded; in 1953 there were about 22,000 beds in these kinds of institutions.

²Estimated.

³Adjusted for under reporting - will not agree with total number of patients published in the April 1, 1954 issue of the Index of Hospitals and Sanatoria, PHS Pub. No. 412.

Non-Federal Hospitals

Table 2 shows the distribution by State of all the non-Federal hospitals, the number of beds (rated capacity), the number of beds available to patients, and the number of tuberculosis patients occupying beds on April 1, 1955.

The non-Federal hospitals which accounted for 81.5 percent of all tuberculosis beds and 80.1 percent of all tuberculosis patients hospitalized on April 1, 1955, showed a decline in occupancy of 4.6 percent. Table 3 shows, by State, the changes between April 1, 1954, and April 1, 1955, in the number of tuberculosis patients hospitalized in these institutions. This latter table serves to illustrate the great differences geographically in the change in tuberculosis bed occupancy over the period of one year. For instance, while one State experienced a decrease in the number of non-Federal tuberculosis beds occupied of more than 31 percent, another State experienced an increase of more than 37 percent. Ten States and 2 of the Territories showed decreases of less than 5 percent; 9 States showed decreases of between 5 and 10 percent, and 12 States and one Territory had decreases of more than 10 percent. Seventeen States showed increases in bed occupancy ranging from less than 1 percent to more than 37 percent, and one State showed no change.

In table 4 a comparison is made of the number of patients occupying tuberculosis beds in 1954 with the number occupying beds in 1955. The hospitals are grouped by type and by ownership. In this table the column for "number of hospitals" includes some hospitals which were closed by 1955 and some which did not open until 1955. This column is included in this table,

TABLE 2. FACILITIES FOR THE CARE OF TUBERCULOSIS PATIENTS IN NON-FEDERAL INSTITUTIONS, BY STATE - APRIL 1, 1955

| AREA | Tuberculosis Hospitals and Other Hospitals with Assigned Tuberculosis Beds ¹ | | | | Other Hospitals Accepting Tuberculosis Patients |

¹Adjusted for over-reporting.

not as a count of the number of hospitals in any period but to show the relative number of hospitals in each category. Footnote 1 to table 4 shows the details of the opening and closing of hospitals. When the type of hospital is considered, the non-Federal tuberculosis hospitals show an average decrease in the number of beds occupied of 4.3 percent. The remaining 144 hospitals in the non-Federal group are chiefly general hospitals which have 5 or more tuberculosis beds. The number of tuberculosis beds occupied in these hospitals declined by 6.2 percent.

Pattern of Change

The States which show the largest decline in tuberculosis bed occupancy are the ones which, in general, have the greatest number of tuberculosis beds per newly reported active tuberculosis case. The changes in absolute numbers or percentages seemed to follow no geographic pattern, nor was there relationship between the changes in tuberculosis beds occupied and the rate of newly reported tuberculosis cases or deaths.

In order to investigate the change in bed occupancy by size of institution over the one-year period, tables 5 and 6 were constructed. The object of this analysis is to show for the size groups of 1954, whether or not the changes in occupancy are related to the size of the hospital. In order to prevent any existing relationship from being obscured by the opening of new hospitals or by change in size of existing hospitals, all hospitals were classified in 1954 and in 1955 by their size in 1954, and hospitals which took tuberculosis patients on April 1, 1955, but not on April 1, 1954, were omitted from these 2 tables. Table 5 shows the hospitals grouped by size and type; table 6 shows them grouped by size and ownership.

The analysis indicates that the greatest average percentage decline in number of tuberculosis beds occupied occurred in the smallest hospitals. Hospitals with less than 50 beds showed the largest decrease. The average decrease in beds occupied for this group is almost 21 percent. For hospitals with between 50 and 99 tuberculosis beds, the average decrease was about 10 percent, and for hospitals with between 100 and 149 beds, the average decrease was 8.0 percent. Table 6 shows that this relationship extends to the groups of still larger hospitals -- the larger the hospital, the smaller the average percentage decline in number of beds occupied, with the group having 500 or more beds showing an average decrease of less than one percent. This relationship appears to be confined to those institutions classified as tuberculosis hospitals. While table 5 shows this relationship for the total groupings and for the tuberculosis hospitals separately, when the group called "all other" (chiefly general hospitals with facilities for tuberculosis patients) is considered separately, there is no apparent trend by size.

When the ownership of the hospital is considered, it is evident that the change in the occupancy of tuberculosis beds in the State-owned hospitals is small -- an increase of less than one percent. The private hospitals, however, show an average decline of about 16 percent, with the local government hospitals showing a decline in occupancy of six and one-half percent. (The groups called "private" in this discussion are labeled "other non-Federal" in the tables. The classification, however, refers to the ownership of the hospitals and not to the source of funds for the care of the tuberculosis patients. The care of some patients in nongovernment hospitals is provided at public expense. Some of the changes in tuberculosis bed occupancy in the private hospitals are due to changes in the availability of public money for the care of patients in private hospitals.)

TABLE 4. CHANGE IN NUMBER OF TUBERCULOSIS BEDS OCCUPIED, BY TYPE AND CONTROL OF HOSPITAL
UNITED STATES AND TERRITORIES: APRIL 1, 1954 - APRIL 1, 1955

| Other Federal Hospitals | 7 | 580 | 605 | + 25 | + 4.3 |

¹Fifty-two of these hospitals had tuberculosis patients on April 1, 1954 but were closed to tuberculosis patients by April 1, 1955 and 7 hospitals which had a specific number of tuberculosis beds in 1954, had none in 1955. The difference, 534, represents the number of non-Federal hospitals which were in operation on April 1, 1955. Three new hospitals are included in this number, as well as 9 hospitals which had no tuberculosis beds in 1954.

²Adjusted.

³Adjusted for underreporting.

⁴Adjusted for overreporting.

⁵For comparative purposes the number of beds occupied has been enumerated on the basis of the reporting method in effect on April 1, 1955.

¹Intervals in this column represent the official tuberculosis bed capacity on April 1, 1954 for each of the hospitals included in that interval.

²The numerical and percent changes shown for the total in this table do not agree with those shown in tables 3 and 4. Tables 3 and 4 compare the hospitals which had tuberculosis beds on April 1, 1954 with the hospitals which had tuberculosis beds on April 1, 1955. Table 5 compares tuberculosis bed occupancy by size and type of the hospitals as they were classified on April 1, 1954. All new tuberculosis hospitals, as well as hospitals which since that date newly set up tuberculosis units, have necessarily been excluded. Tables 3 and 4 are more appropriate for understanding overall changes in tuberculosis bed occupancy; table 5 is more appropriate for understanding changes for specific size and type categories.

³Adjusted for overreporting.

⁴Adjusted for underreporting.

State tuberculosis hospitals are, on the average, the largest; local government hospitals are intermediate in size, and private hospitals are the smallest. Since there is this relationship between the ownership of tuberculosis hospitals and their size, an analysis was made in the earlier study which covered the eight-month period between the spring of 1954 and the fall of 1954, to determine whether the relative changes in tuberculosis bed occupancy were associated with the hospitals because of their size or because of their ownership. The results of that study seemed to indicate that size was probably a more important determinant of the change in tuberculosis bed occupancy than was ownership. The present study, which had complete coverage

TABLE 6. CHANGE IN NUMBER OF TUBERCULOSIS BEDS OCCUPIED IN NON-FEDERAL HOSPITALS BY SIZE (TB RATED CAPACITY ON APRIL 1, 1954) AND CONTROL OF HOSPITAL, UNITED STATES AND TERRITORIES, APRIL 1, 1954 - APRIL 1, 1955

¹Intervals in this column represent the official tuberculosis bed capacity on April 1, 1954 for each of the hospitals included in that interval.

²The numerical and percent changes shown for the total in this table do not agree with those shown in tables 3 and 4. Tables 3 and 4 compare the hospitals which had tuberculosis beds on April 1, 1954 with the hospitals which had tuberculosis beds on April 1, 1955. Table 6 compares tuberculosis bed occupancy by size and control of the hospitals as they were classified on April 1, 1954. All new tuberculosis hospitals, as well as hospitals which since that date newly set up tuberculosis units, have necessarily been excluded. Tables 3 and 4 are more appropriate for understanding overall changes in tuberculosis bed occupancy; table 6 is more appropriate for understanding changes for specific size and control categories.

³Adjusted for overreporting.

of tuberculosis hospitals in the United States and Territories, seems to indicate that ownership is perhaps the more important determinant. Table 6 shows that, in general, the State-owned hospitals had the smallest decline, with some of the hospitals in the larger size groups showing an increase

Occupancy. In all size groups except one (250-499), the private hospitals had the largest percentage decline. The local government hospitals had considerably smaller declines in most size groups than did the private hospitals.

These tables (5 and 6) are constructed on a different basis than table 4. Table 4, as previously indicated, shows a comparison of the number of tuberculosis patients hospitalized in 1954 in all hospitals having rated capacities of 5 or more tuberculosis beds in 1954, with the number of tuberculosis patients hospitalized in 1955 in all hospitals having rated capacities of 5 or more tuberculosis beds in 1955. The hospitals representing each period are different, in part, because some hospitals closed and others opened during the year. Tables 5 and 6, on the other hand, concern only of hospitals which were in operation both in April 1954 and April 1955. They are ordered by the size (TB bed capacity) of the institution in 1954, in order to show how tuberculosis bed occupancy has changed in the one-year period for hospitals in certain size, type and ownership categories. It is for that purpose only that they are included here. Similar tabulations for all hospitals with tuberculosis beds, showing occupancy by size, type and control for April 1, 1954, and April 1, 1955, are available and will be provided upon request.

Distribution of Closed Facilities in Non-Federal Hospitals

Fifty-two of the 581 non-Federal hospitals which took tuberculosis patients on April 1, 1954, were no longer taking such patients by April 1, 1955. These 52 hospitals had a total of 2,962 tuberculosis beds (official rated capacity). In the same period it is known that three new tuberculosis hospitals opened with a capacity of 610 tuberculosis beds. This resulted in a net increase of 2,962 in the number of tuberculosis beds in the United States and Territories as a result of the closing of old hospitals to tuberculosis patients and the opening of new ones. Corresponding net decrease in tuberculosis bed occupancy is 2,029.

Nearly half of the closed institutions were located in two States; the remaining number scattered throughout 13 States and one Territory.

Forty-three of the institutions which had closed to tuberculosis patients were tuberculosis hospitals, the majority of which were old and had a fairly small capacity for tuberculosis patients. Of the 43 were from 50 to 86 years old; 14 were from 31 to 49 years; 19 were from 13 to 29 years; and only four were less than ten years old. The dates of establishment of the two remaining small facilities are unknown. Twenty-four of these tuberculosis facilities had less than 50 beds; eight had from 50 to 74 beds; and the remaining 11 hospitals had 75 beds or more. Nineteen of the tuberculosis facilities were privately owned, three were State owned, and all others were owned by the local government -- city, county, or district.

The remaining nine hospitals in the non-Federal group were general hospitals which closed and converted their tuberculosis wards. These facilities were in old hospitals -- six of the hospitals ranging from 35 to 100 years old, and three from 14 to 26 years old. Four of the nine hospitals had less than 25 tuberculosis beds; only two had 50 beds or more. All except three were owned by the local government; these were privately owned.

Forty-four of the 52 closed institutions had less than 50 tuberculosis patients each on April 1, 1954. The other eight institutions had 50 or more patients hospitalized on that date. Table 7 shows the distribution of closed hospitals by rated capacity for tuberculosis.

TABLE 7. DISTRIBUTION OF CLOSED NON-FEDERAL TUBERCULOSIS FACILITIES, BY SIZE,
APRIL 1, 1954 - APRIL 1, 1955

¹Intervals in this column represent the official tuberculosis bed capacity on April 1, 1954, for each of the hospitals included in that interval.

Federal Hospitals

In the 138 Federal hospitals there is a decrease in tuberculosis bed occupancy of 4.8 percent (table 4). One hundred and four of the Federal hospitals (about 75 percent) are Veterans Administration hospitals in which there were 15,250 beds occupied by tuberculosis patients on April 1, 1955. This number represents 81 percent of the total number of tuberculosis beds occupied in the 138 Federal hospitals. The number of beds occupied in the Veterans Administration hospitals has decreased by 3.1 percent; this is considerably smaller than the decrease of 11.3 percent which occurred in the other Federal hospitals during the same period. The decrease of 3.1 percent, experienced by the Veterans Administration hospitals, however, reflects only the change in the number of persons hospitalized for tuberculosis in Veterans Administration hospitals; it does not take account of those persons hospitalized under VA contracts in other hospitals. care under VA auspices in contract hospitals has policy of decreasing contract hospitalization and essence of a decreased demand for tuberculosis beds occupancy in other Federal hospitals and in non-

¹Less than 5 beds assigned for tuberculosis patients.

In connection with the demand for tuberculosis beds, it is important to have reliable data also about waiting lists. Such data are not available for the whole United States, but the Veterans Administration indicated that the number of patients on its waiting list had been cut in half between the period March 31, 1954, and November 30, 1954. Here, however, one must remember that a substantial number of patients may have obtained hospitalization elsewhere before they were reached on the waiting list.

Interpretation of the Data

The decrease in tuberculosis bed occupancy is a phenomenon of relatively recent times. The trend has been steadily upward, reaching its peak in 1953. Between April 1, 1953, and April 1, 1954, the decline in the number of patients occupying tuberculosis beds was very small -- less than one percent; but between April 1, 1954, and April 1, 1955, the decline was between 4 and 5 percent. This result should not be interpreted, however, to mean a tuberculosis bed surplus for the whole country or even necessarily for all States which showed a decrease in tuberculosis bed occupancy. In some areas of States there are still acute bed shortages for specific age, sex, or racial groups, even when the State shows a decline in the number of beds occupied. For instance, West Virginia shows a decrease during the period of this latest survey of 11.1 percent in the number of non-Federal beds occupied. However, according to the report of a Public Health Service staff member on October 12, 1955, there was a waiting list for male patients in Hopemont, and in the sanatorium at Beckley there are no beds for children. In Denmar, beds are available for Negro patients only. It is also known that some of the decline in the occupancy of tuberculosis beds in this State is not due to the lack of need, but is the result of the failure on the part of patients who need hospitalization to take advantage of the opportunity.

In Wisconsin, where the decline in tuberculosis bed occupancy was about 5 percent, there were some 600 known active cases of tuberculosis unhospitalized. These 600 cases, if hospitalized in Wisconsin sanatoria, would more than fill the vacant beds.

California shows a decline in occupancy of more than ten percent, but reports received from Los Angeles indicate that a waiting list still exists.

In Kentucky, which showed a small decrease of three percent in tuberculosis bed occupancy, there is a waiting period. One State tuberculosis hospital stated that beds were unoccupied on the day of this Public Health Service survey (April 1, 1955) because they were at that time in the process of notifying patients on the waiting list that beds were now available to them. In Virginia, where there was a small decrease of about two percent, it is useful to notice that at the time of the survey, one sanatorium reported its vacant beds were the result of the change in its policy taking place at that time of converting all tuberculosis beds to the use of Negro patients. All white patients had either been transferred or discharged and the beds were temporarily vacant, awaiting the Negro patients coming in.

At this point, attention is directed to the fact that 12 of the States which showed a decline in tuberculosis bed occupancy in the 8-month period between the spring of 1954 and the fall of 1954, show substantial increases in bed occupancy over the 12-month period, April 1, 1954 - April 1, 1955, covered by this survey. We have been able to identify the reasons for some of these differences. The earlier study was based upon reports from most but not all of the hospitals

which take tuberculosis patients. This study is based upon reports from all such hospitals. In some States we had, in the earlier study, a disproportionate number of hospitals with low occupancy rates reporting. Some of the hospitals for which data were not available in the earlier study, had high tuberculosis occupancy rates. In other instances, the number of beds occupied in some hospitals had increased by April 1, 1955, to the point where the final results showed the State had an increase in tuberculosis bed occupancy rather than the decrease which was evidenced by data available at the time the earlier study was made. Missouri, which was one of the States which showed a decrease in occupancy of 7.2 percent for the eight-month period (spring 1954 - fall 1954), shows an increase of 6.8 percent for the period of this complete survey. This is more in keeping with the information available in regard to this State, that there is not a surplus of tuberculosis beds in Missouri. It is known that in October 1954 there were 41 patients awaiting admission to the State sanatorium at Mount Vernon.

Alabama, which was another of the States showing a decrease in tuberculosis bed occupancy in the eight-month period, shows an increase for the period of this survey. This, too, is more in keeping with the information contained in the 1954 annual report for the Jefferson Tuberculosis Sanatorium that there were more than 80 Negro patients awaiting admission to the institution.

Mississippi, another of the States pointed up as showing a decrease in tuberculosis bed occupancy in the eight-month period, shows an increase of about four percent in this most recent survey. Again this is in line with the information received from the report of a Public Health Service staff member on April 18, 1955, that there were 245 Negroes on the waiting list, and even this number was deemed an underestimate of the actual number of patients waiting for beds, since many applications were not filed because of the long waiting list.

A decrease in bed occupancy can occur in a given State even in the presence of a need for additional beds. The figures reflect, at best, only changes in demand. Because of the difference between demand and need, these data should not be used as a direct measure of the change in need for tuberculosis hospital beds. Moreover, more beds than are now occupied or needed would be required if tuberculosis casefinding and follow-up were more aggressively implemented. In "Tuberculosis Casefinding in Iowa"¹ it is stated that three-fourths of all of the cases of tuberculosis diagnosed in Iowa during 1952 came to diagnosis "because of symptoms associated with tuberculosis." Many of these cases could have been found earlier by aggressive casefinding.

Another study² in Polk County, Iowa, including the city of Des Moines, showed that about 60 percent of the 83 new tuberculosis cases discovered during 1952 and 1953 came to diagnosis because of symptoms. Moreover, for two-thirds of the cases, earlier occasions were identified when a diagnosis of tuberculosis might have been made. Forty percent of the missed opportunities were attributed to a break in the follow-up procedure. It is especially interesting to note that the "missed opportunities" were identified only among the moderately and far advanced cases; none could be found for the minimal cases.

Additional evidence that X-ray casefinding has not yet reached the limit of its usefulness is found in the facts that:

More than three-fourths of the new active cases of tuberculosis reported during each of the years 1952, 1953, and 1954 were in the advanced stages of the disease and indicate the continuing need for vigorous action to stimulate more early casefinding. There has been essentially no change in the proportion of cases reported as minimal, moderately advanced, and far advanced when the data are compared for these three years.

Two fundamental concepts point up the urgency for more early casefinding: (1) the great majority of cases of tuberculosis are not demonstrated except by means of an X-ray examination and (2) the extent and prognosis of the disease depend essentially upon how early it is detected. Even with recent advances in chemotherapy, the earlier the case is found and put under medical care, the greater the hope for recovery and return to a productive life.

Summary of Changes in TB Bed Occupancy between April 1, 1954, and April 1, 1955.

1. The average decrease in the number of tuberculosis patients occupying beds in all hospitals was 4.6 percent.
2. The average decrease in the number of tuberculosis patients occupying beds in non-Federal hospitals was 4.6 percent.
3. The changes in tuberculosis bed occupancy seemed to follow no geographic pattern, but the States which show the largest decline in non-Federal tuberculosis bed occupancy are the ones which, in general, have the largest ratios of tuberculosis beds per annual newly reported active tuberculosis case.
4. In general, the State-owned hospitals had the smallest decline, with some hospitals in the larger size groups showing an increase in occupancy. In all size groups except one, the private hospitals had the largest percentage decline. The local government hospitals had considerably smaller declines in most size groups than did the private hospitals.
5. The greatest average percentage decrease in number of non-Federal tuberculosis beds occupied has occurred in the smaller hospitals; the larger the hospital, the smaller the average percentage decrease in number of beds occupied.
6. One-third of the States show increases in bed occupancy; the balance show decreases. All the States which show decreases, however, do not have a surplus of beds.
7. About 90 percent of all Federal beds were in use on April 1, 1955; however, the number of patients hospitalized on this date indicates an average decline in the occupancy of Federal facilities of 4.8 percent. The Veterans Administration hospitals, accounting for about 79 percent of the beds in the Federal group, show an average decrease in tuberculosis bed occupancy of 3.1 percent. The average decrease in tuberculosis bed occupancy in the remaining Federal hospitals (Army, Navy, Air Force, Public Health Service, and the former Bureau of Indian Affairs) is 11.3 percent.
